Distributed systems can be made up of any machine capable of connecting to a network, having local memory, and communicating by passing messages. By spreading out requests and workloads, distributed systems can support far more requests and compute jobs than a standard single system.

A distributed network is a type of computer network that is spread over different networks. This provides a single data communication network, which can be managed jointly or separately by each network. Besides shared communication within the network, a distributed network often also distributes processing. Techopedia
