Handbook Of Optical Constants Of

The first part of the Handbook of Optical Constants of Solids II (HOC II) consists of short topics dealing with the determination of optical constants. The chapter also describes critiques that are the critique's own judgment of the best values of refractive index n and extinction coefficient k over the widest spectral range.

The Electronic Handbook of Optical Constants of Solids takes the highly praised five-volume set, Handbook of Optical Constants of Solids, to a new level of "information mining" with seamless integration of dynamic data tables, 2D and 3D displays, property calculations, and technical information. The program is designed for amterial scientists, spectroscopists, and optical device designers working with dielectric materials, including metals, semi-conductors, and insulators.

Overview This volume in the Handbook of Optical Constants of Solids is the first and only book to provide comprehensive coverage of refractive index and thermo-optic coefficients. It contains the refractive indexes and thermo-optic coefficients for nonlinear crystals, semiconductors, optical glasses, and fiber glasses.

Handbook of Optical Constants of Solids. Edward D. Palik, Edward D. Palik. While bits and pieces of the index of refraction n and extinction coefficient k for a given material can be found in several handbooks, the Handbook of Optical Constants of Solids gives for the first time a single set of n and k values over the broadest spectral range (ideally from x-ray to mm-wave region).

The singular functionality of the set derives from the unique format for the three core volumes that comprise the Handbook of Optical Constants of Solids. The Handbook satisfies several essential needs: first, it affords the most comprehensive database of the refractive index and extinction (or loss) coefficient of technically important and scientifically interesting dielectrics. This data has been critically selected and evaluated by authorities on each material.

The Handbook of Thermo-Optic Coefficients of Optical Materials with Applications collects refractive index measurements and their temperature dependence for a large number of crystals and glasses. Mathematical models represent these data, and in turn are used in the design of nonlinear optical devices.
