So whilst the practice of using molecular modeling as an underpinning technology for larger scale simulation is somewhat new, the idea, the dream, is older than me. There's a reason his biography is called "Genius". Currently my days, and above all my working thought processes, are dominated by multiscale modeling.

Abstract. The aim of this work is to compare two existing multilevel computational approaches coming from two different families of multiscale methods in a nonlinear solid mechanics framework. A locally adaptive multigrid method and a numerical homogenization technique are considered. Both classes of methods aim to enrich a global model representing the structure's behavior with more sophisticated local models depicting fine localized phenomena.
